Live App growth: last 30 days

Sep 3 to Oct 2, 2026 (PT) vs the prior 30 days. External, non-partner customer instances.

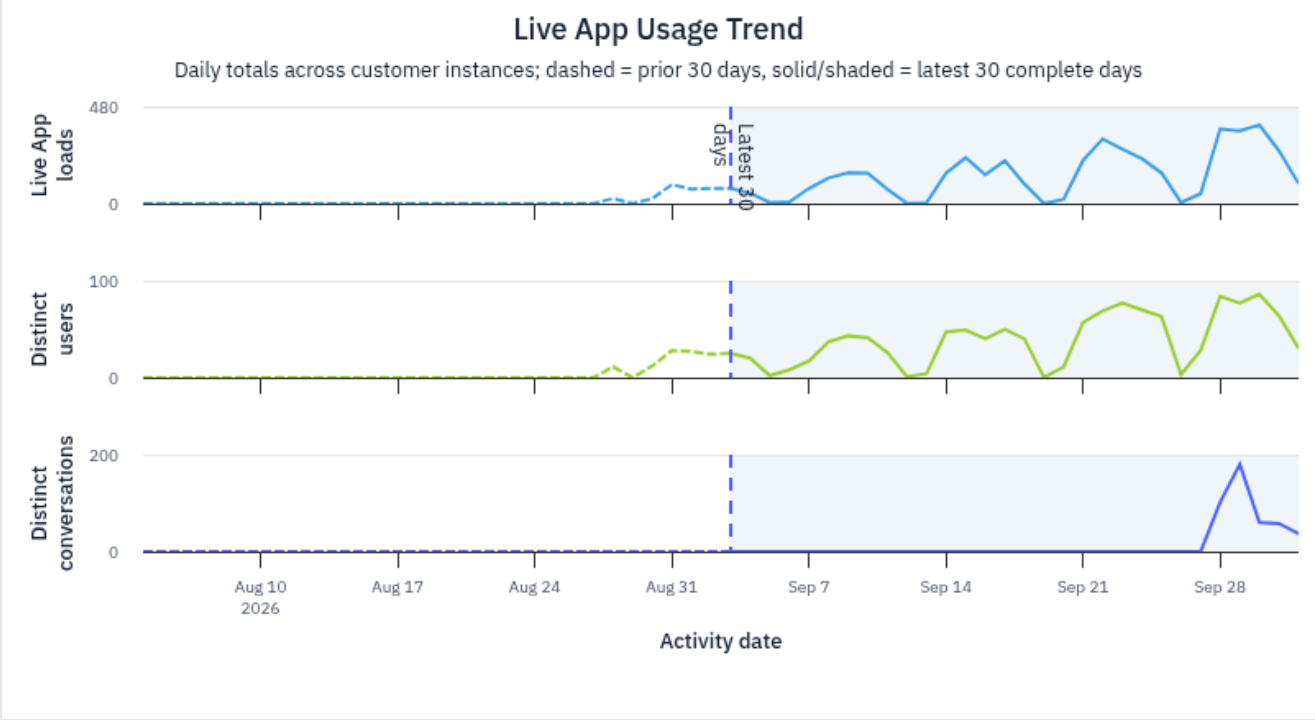

3 October 2026

Headline

- **Yes, Live Apps grew.** Loads were 4,284 in the last 30 days against 290 in the prior 30, up 1,377%.
- **Distinct users** were 231 against 47, up 391%.
- **App conversation activity** (proxy signal) shows 457 events across 437 distinct conversations. It first appears on Sep 28, so there is no prior period to compare against.
- **Read the % with care.** Load telemetry only starts on Aug 28. The prior window has data for its last 6 days only, so the percentages overstate growth. The weekly trend inside September is the cleaner signal (next section).

Daily trend, 60 days

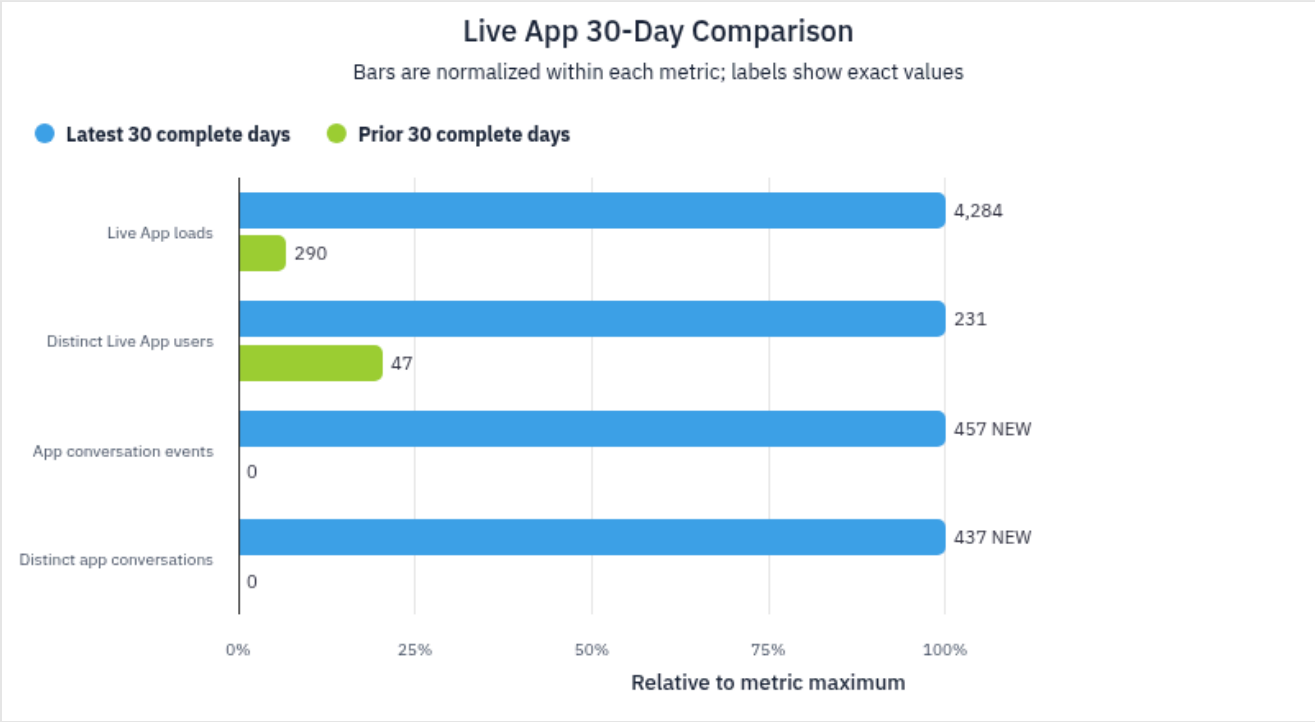

Weekday usage climbs every week through September. Monday load counts: Sep 8 had 127 loads and 37 users, Sep 14 had 151 and 47, Sep 21 had 214 and 57, and Sep 28 had 370 and 84. The peak was Sep 30 with 389 loads and 86 users. Weekend dips are normal.

Daily Live App loads, distinct users and distinct app conversations, Aug 4 to Oct 2.

30-day comparison

The latest period is indexed to 100. On that scale the prior period is about 7 for loads and 20 for users, and 0 for conversation activity.

Latest 30 days indexed to 100 against the prior 30 days.

Method and caveats

- Loads and users come from the `live_app_load` event.
- Conversation activity comes from `live_app_crawl_gate`, keyed by `conversation_id`. It measures conversation processing, not user messages.
- Internal users, internal instances and partner customers are excluded.
- Telemetry begins on Aug 28, so the prior-period baseline is partial.
